Over 21,000 signatures on petition against use of S'pore govt-issued wearable contact tracing devices

The device has not yet been developed.

Sulaiman Daud | June 07, 2020, 09:07 PM

Kulwant Singh · 4 hours ago
I am not supporting this. For a 1st world country to propose this, is not only shameful but a blatant disregard of the people's voice, rights and freedom. If this the best as a country, then, i have nothing more to say, because we have completely lost the plot.

5 · Report

Joel Seah · 5 hours ago
This is clearly an invasion of privacy. And no discussions or deliberations (or even engagement with the general public) have been conducted on the ethical implications and ramifications of making it mandatory for individuals to wear such tracking devices.

4 · Report

Gurmali Kaur · 6 hours ago
After months of lockdown fiasco, now this? Isn't the oppression and control obvious?

4 · Report

An online petition opposing the use of wearable devices for contact tracing has been put up on Change.org.

Events

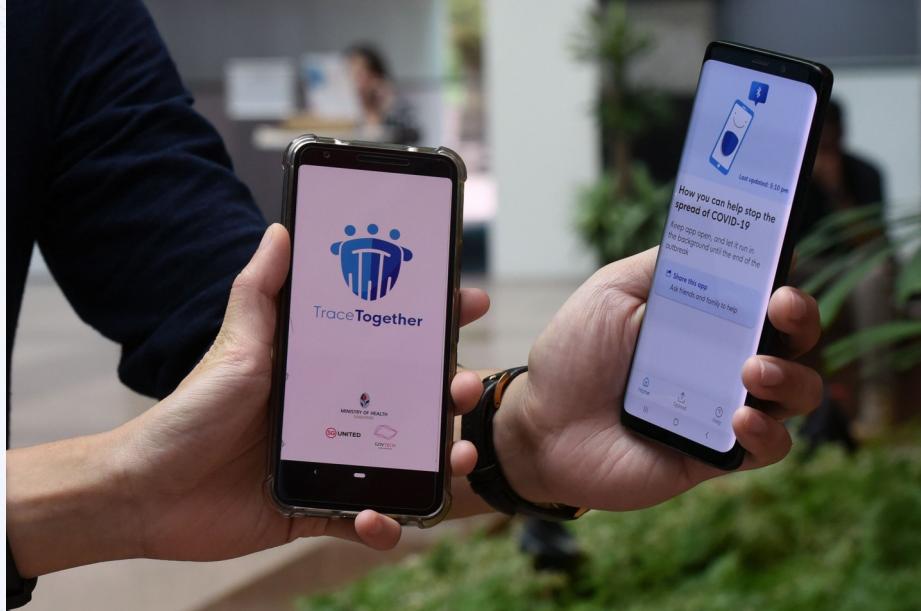

Naturally, Singaporeans had concerns about TraceTogether

Contact Tracing - TraceTogether

So they ran a teardown session and invited hackers like bunnie

Contact Tracing - TraceTogether

Can people trust centralized contact tracing systems like TraceTogether?

Contact Tracing – Models and Protocols

Centralized:

- BlueTrace (Used in TraceTogether and COVIDSafe)
- Pan-European Privacy-Preserving Proximity Tracing (PEPP-PT)

Decentralized:

- Exposure Notification
- Decentralized Privacy-Preserving Proximity Tracing (DP-3T)
- Temporary Contact Numbers (TCN) Protocol

BlueTrace - Overview

BlueTrace: A privacy-preserving protocol for community-driven contact tracing across borders

Jason Bay, Joel Kek, Alvin Tan, Chai Sheng Hau, Lai Yongquan, Janice Tan, Tang Anh Quy

Government Technology Agency
Singapore

ABSTRACT

TraceTogether is the first national deployment of a Bluetooth-based contact tracing system in the world. It was developed by Singapore's Government Technology Agency and the Ministry of Health to help the country better respond to epidemics.

Following its release, more than 50 governments have expressed interest in adopting or adapting TraceTogether for their countries. Responding to this interest, we are releasing an overview of **BlueTrace**, the privacy-preserving protocol that underpins TraceTogether, as well as **OpenTrace**, a reference implementation.

tracking users. The user's encounter history is stored locally on their user's device; none of this data can be directly accessed by the health authority.

If a user is infected or is the subject of contact tracing, they will be asked to share their encounter history with the relevant health authority with the use of a PIN. (A verification code may optionally be provided, to authenticate the health authority official's request.) Only the health authority has the ability to decrypt the shared encounter history to obtain and use personally-identifiable information to filter for close contacts and contact potentially infected users.

BlueTrace is designed to supplement manual con-

Implementation details published in GovTech whitepaper

}
```

Exposure Notification - Overview

Advertising¹ Payload

The Exposure Notification Service payload shall be ordered as shown below and shall not include other data types.

Flags			Complete 16-bit Service UUID			Service Data - 16 bit UUID				
Length	Type	Flags	Length	Type	Service UUID	Length	Type	Service Data		
0x02	0x01 (Flag)	0x1A	0x03	0x03 (Complete 16-bit Service UUID)	0xFD6F (Exposure Notification Service)	0x17	0x16 (Service Data - 16 bit UUID)	0xFD6F (Exposure Notification Service)	16 bytes Rolling Proximity Identifier	4 bytes Associated Encrypted Metadata

Payload format – taken from EN Bluetooth Specification Document

Exposure Notification - Overview

The Exposure Notification Service payload has four sections:

1. Flags Section — Bluetooth Low Energy general discoverable mode (bit 1) shall be set to 1.
2. Complete 16-bit Service UUID Section — The UUID is 0xFD6F, and shall precede the Service Data section.
3. Service Data 16-bit UUID Section — This section shall have two different sections in its payload:
 - a. A 16 byte Rolling Proximity Identifier.
 - b. A 4 byte Associated Encrypted Metadata that contains the following (LSB first):
 - i. Byte 0 — Versioning.
 - Bits 7:6 — Major version (01).
 - Bits 5:4 — Minor version (00).
 - Bits 3:0 — Reserved for future use.
 - ii. Byte 1 — Transmit power level.
 - This is the measured radiated transmit power of Bluetooth Advertisement packets, and is used to improve distance approximation. The range of this field shall be -127 to +127 dBm.
 - iii. Byte 2 — Reserved for future use.
 - iv. Byte 3 — Reserved for future use.

Exposure Notification - Privacy

Maintaining user privacy is an essential requirement in the design of this specification. The protocol maintains privacy by the following means:

- The Exposure Notification Bluetooth Specification does not use location for proximity detection. It strictly uses Bluetooth beacons to detect proximity.
- A user's Rolling Proximity Identifier changes on average every 15 minutes, and needs the Temporary Exposure Key to be correlated to a contact. This behavior reduces the risk of privacy loss from broadcasting the identifiers.
- Proximity identifiers obtained from other devices are processed exclusively on device.
- Users decide whether to contribute to exposure notification.
- If diagnosed with COVID-19, users must provide their consent to share Diagnosis Keys with the server.
- Users have transparency into their participation in exposure notification.

TraceTogether Implementation – App

TraceTogether Implementation – Token

TraceTogether Token

Technical Write-up

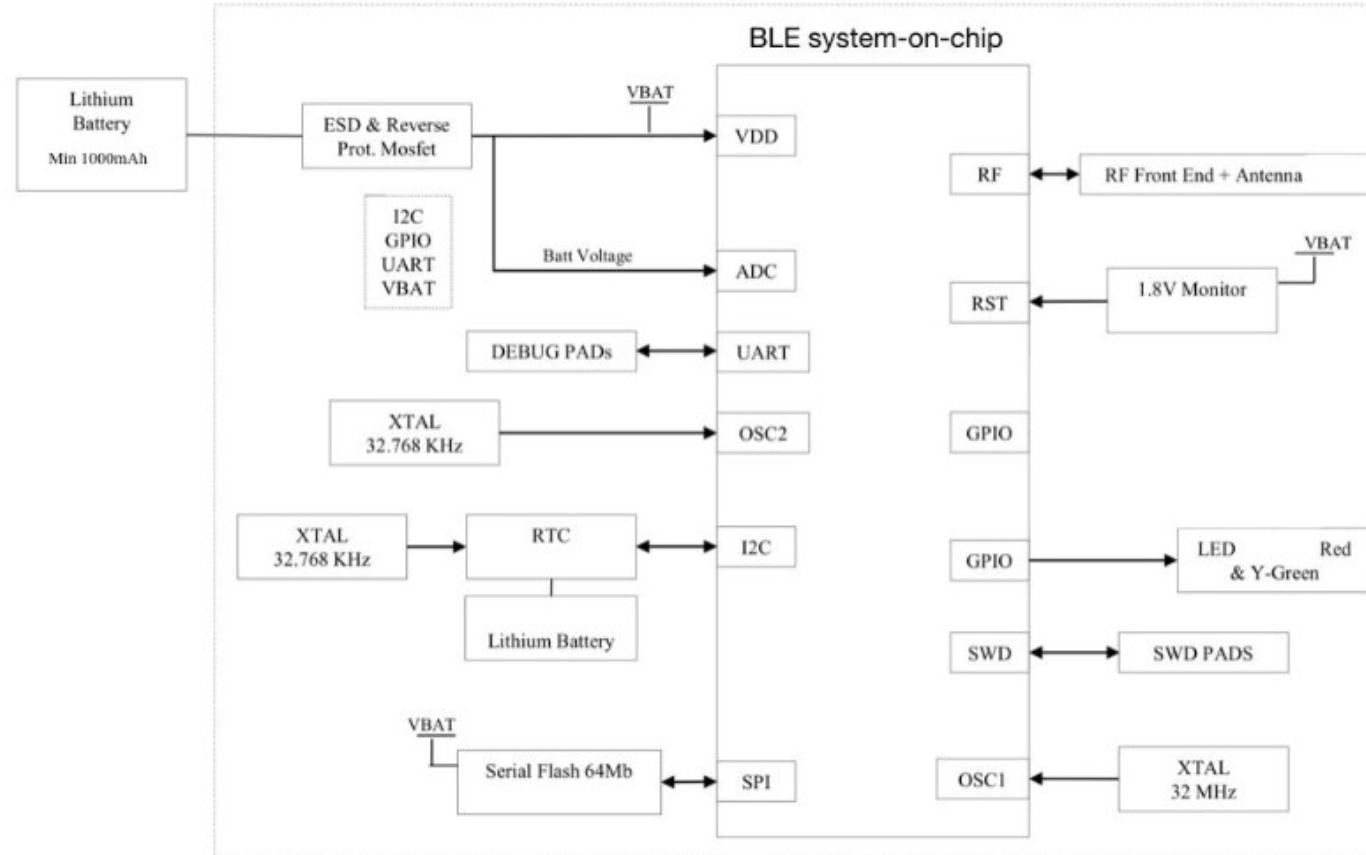

Yang Boon Quek, Director, Sensors and IoT
Government Technology Agency of Singapore

1 Introduction

TraceTogether is Singapore's national deployment of a Bluetooth-based digital contact tracing system to manage the COVID-19 pandemic. The TraceTogether Programme comprises a smartphone app and a portable device (token) of the same name, developed by the Government Technology Agency of Singapore (GovTech) in collaboration with the Ministry of Health. The TraceTogether Token is developed to facilitate greater participation in contact tracing by population segments that include the elderly and children, as well as those who do not have smartphones. This Technical Write-up shares the design and protocol of the TraceTogether Token to enable interoperability of third-party Devices (3PD) within the TraceTogether Programme.

3 BlueTrace Lite Protocol

3.1 Interoperability Technical Details: Packet Structure

- **Licensing:**
 - GovTech will assign a Company ID (Version & ID, Byte 18 and 19) for each company interoperating with TTT
 - 1 x 16 bytes Global Replay Protection Key (RPK) will be provided to each Company

TraceTogether Implementation – Token

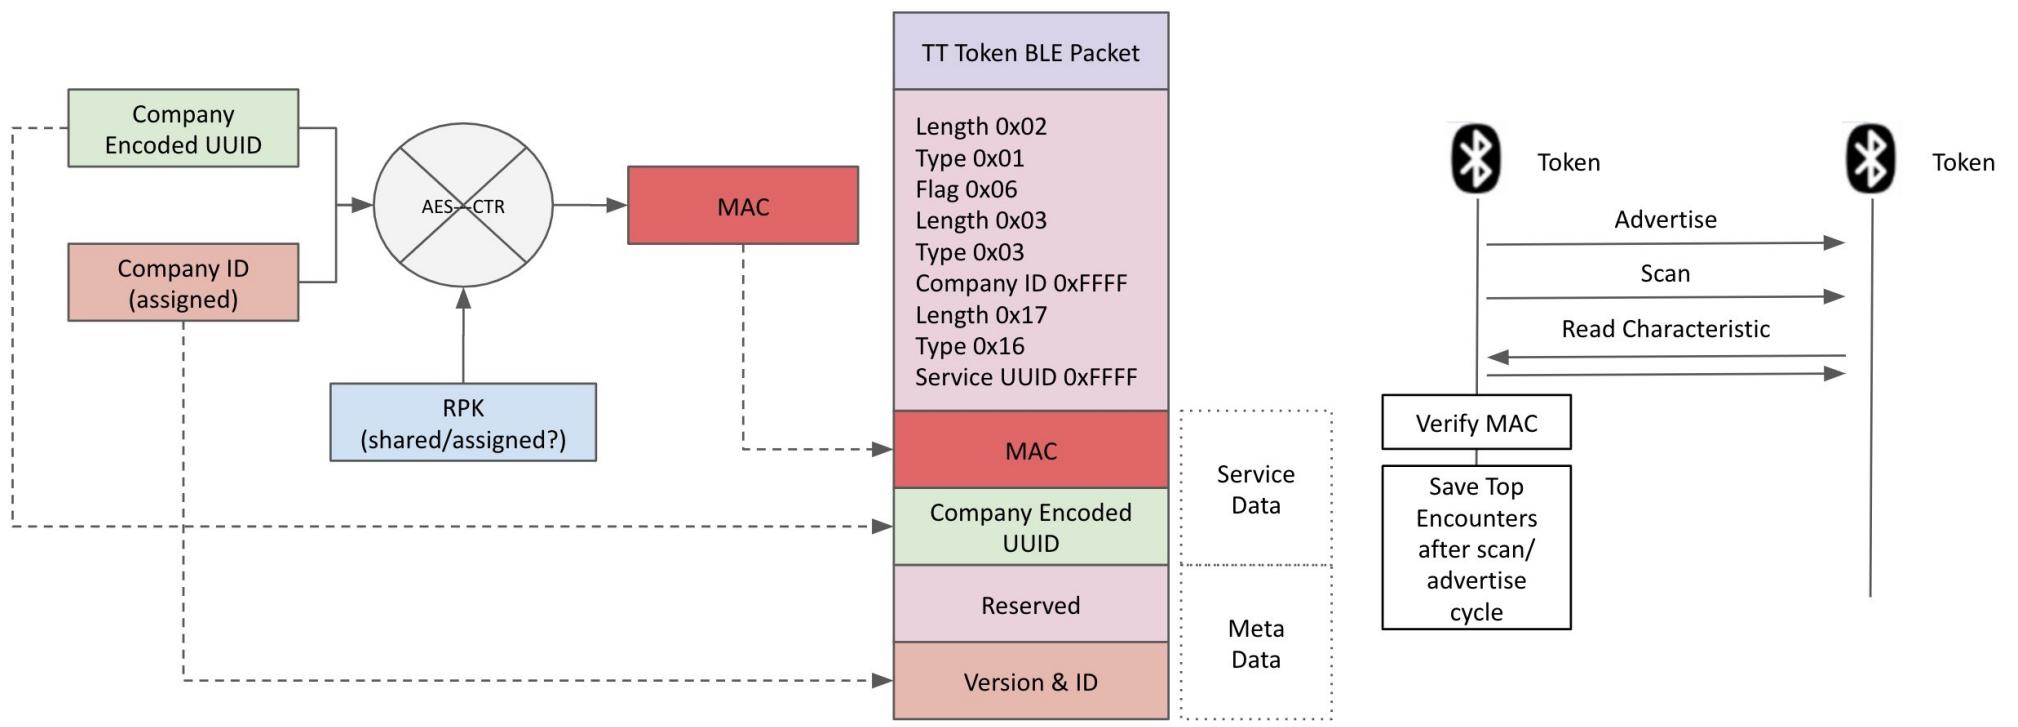

3.2 Storage packet to flash memory

When TraceTogether Token scan the packet advertised by another TraceTogether Token, the receiving Token will then record the data in the flash memory in the following format. Subsequently, if there is a need to contact trace, this record can then be extracted using BLE GATT connection.

Protocol	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

SafeEntry Gateway – Teardown

Basically a TraceTogether Pod V1.2 Rev F + nRF9160 4G IoT cellular modem!

Main hardware components:

U1: nRF9160 4G IoT cellular SiP

U5: GD25WQ64E 64Mbits Serial NOR Flash memory

U6: ST Microelectronics STM32WB55CG MCU with BLE 5.4

TraceTogether – Policy Analysis

With the introduction of the Gateway, has the privacy assumptions changed?

TraceTogether – Policy Analysis

The "Trust Balance"

Public:
Need high social trust
More individual privacy

Centralized Authority:
Need high trust in authority
Less individual privacy

Where is TraceTogether on the “Trust Balance?”

TraceTogether – Policy Analysis

Centralised vs decentralised contact tracing

BlueTrace envisages a blend of **decentralised proximity data collection** and logging, with a **centralised contact tracing capability**.

Encounter messages and encounter histories are exchanged and stored in a decentralised, peer-to-peer manner, without the participation of a central server.

We defer the centralised collection and processing of data to the last possible moment—when a diagnosis of COVID-19 is made—and then provide this data to the trusted public health authority in the OpenTrace reference implementation. Depending on the prevailing trust environment within which public health institutions operate, other jurisdictions may have different considerations that may favour a similar hybrid model or one that is completely decentralised.

We see various challenges with a purely decentralised contact tracing system. Individuals falsely declaring themselves infected would cause unnecessary anxiety and panic in other users, and erode trust

in the system. Some form of authorisation for users to either flag themselves as positive COVID-19 cases, or to upload encounter history, is therefore necessary to protect against abuse.

Ultimately, this will have to be provided by a credentialed health institution or healthcare worker, who may or may not be part of a public health authority's infectious disease surveillance system, but would likely have to obtain the upload authorisation code through a chain of trust rooted in a centralised public health authority. This also has the benefit of ensuring that relevant information about the epidemic and the effect and effectiveness of such contact tracing systems is provided to the public health authority, to aid in planning public health interventions.

Finally, another advantage of a centralised approach is keeping humans in the loop in making the assessment of the appropriate follow-up actions.

Does possibility of abuse necessitate centralized contact tracing?

TraceTogether – Policy Analysis

Human-in-the-loop vs Human-out-of-the-loop

It is possible to implement the BlueTrace protocol and have automated notification of probable close contacts of persons who have been diagnosed with COVID-19. In theory, we appreciate the privacy and scalability benefits of doing so. *In practice, our ongoing conversations with public health authority officials performing epidemic surveillance and conducting contact tracing operations compel us to recommend otherwise.*

An automated algorithm will necessarily generate both false negatives and false positives. A human contact tracer will similarly make mistakes. However, because a human contact tracer would seek to incorporate information beyond just physical proximity, he/she can correct for systematic biases introduced by a purely automated notification system.

Does human intervention necessarily remove biases?

The policy black box in Singapore's digital contact tracing strategy

3 comments | 20 shares

Estimated reading time: 10 minutes

20
Shares

"The emerging consensus is that government agencies must strike the right balance between public health interests and increased surveillance", writes Lazarus Chok, a recent graduate from the LSE Department of Geography & Environment and Master's candidate at the New York University Center for Urban Science + Progress

The COVID-19 pandemic has left cities struggling to reopen their economies while preventing hospital systems from being overwhelmed by recurring viral infections. Due to the novel coronavirus' ability to transmit pre-symptomatically or even asymptomatically, public health experts have deemed it essential for cities to rapidly identify and isolate close contacts of infected persons (Kretschmar et al.. 2020). **Cities around the world** are rolling out contact tracing

TraceTogether – Policy Analysis

SafeEntry is the location tracking complement to TraceTogether (Figure 2). By scanning a Quick Response (QR) code at the premise, users log their time of entry/exit into SafeEntry. All data collected is encrypted and stored on government servers for 25 days. According to SafeEntry FAQs, data will only be accessed for the purposes of “**preventing or controlling the transmission of COVID-19**”, a rather wide mandate compared to TraceTogether’s purpose-limited design. Beyond the intuitive use case of identifying where infected persons visited, SafeEntry data may also be “de-identified and aggregated for analytics purposes”. Ironically, while GovTech incessantly assures citizens that TraceTogether will not store location data, SafeEntry does exactly that – providing a comprehensive log of residents’ movements. Beginning September 14, more venues would progressively trial “**TT-only SafeEntry**” systems where digital check-ins can only be done using the TraceTogether app or token, drafting into question whether the proximity and location databases are interoperable. If interoperability is possible, then the assurances that TraceTogether does not store location data could be moot.

TraceTogether – Policy Analysis

New normals in surveillance

One of the more interesting long-term consequences of habituating citizens to increased surveillance is the ratcheting effect of public policies. Expansions in state surveillance during the COVID-19 pandemic may be difficult to retract as habits stick and ideologies shift to the right. TraceTogether and SafeEntry are novel acts of self-administered surveillance (Rowe, 2020). The high degree of compliance suggests that Singaporean society is growing accustomed to surrendering private data to the government. Will this ratchet up a ‘new normal’ in everyday surveillance administered by the self?

TraceTogether – Policy Analysis

Singapore's partial success at containing COVID-19 has not been tempered by a critical analysis of its tradeoffs. Avoiding discussions of TraceTogether and SafeEntry's efficacy might lead Singaporeans to believe that 'innovative' solutions are merely performing a 'theatre of prevention' (e.g. Datta, 2020), or worse, suspect that they are a facade for something far more disingenuous. Like many other East Asian countries with a strong tradition of state intervention, the dichotomy of public health versus personal privacy has been falsely constructed to justify exceptionally intrusive measures (e.g. South Korea's **disclosure** of patient information). But beyond the intrusiveness of surveillance, this analysis suggests that the dichotomy elides over important questions of efficacy and the acceptability of using private data for large-scale experiments that could unlock, hitherto inaccessible, public good.

TraceTogether data was accessed in May 2020 for Punggol Fields murder investigation

TraceTogether – Policy Analysis

Some cited past remarks by Education Minister Lawrence Wong and Foreign Minister Vivian Balakrishnan on the use of TraceTogether data.

Last June, Mr Wong had said "there is no intention to use a TraceTogether app or TraceTogether Token as a means of picking up breaches of existing rules".

He said at a Multi-Ministry Task Force press conference that "the app and the device, plus SafeEntry, combined are meant to provide us with information in a timely manner so that we can do speedy, and fast and effective contact tracing.

"It's not meant as a way to detect offences and breaches of rules".

TraceTogether – Policy Questions

Some Policy Questions:

- Why is the possibility of abuse of the system a factor in determining using a centralized system over a decentralized one? Don't systems using Exposure Notification or DP-3T protocols require a key from health authorities to even upload contact tracing information? Why a top-down governance approach?
- Bluetrace whitepaper admits "it is possible to implement the BlueTrace protocol and have automated notification of probable close contacts", but dismisses the idea due to bias; who writes the algorithms to begin with, and don't the systemic biases of a centralized organization affect how humans work?
- SafeEntry Gateways are linked to specific locations (such as mall entrances). Doesn't this then create location datapoints that could be used to track a person's movements, invalidating bunnie et al's assessments?

TraceTogether – Policy Questions

Some Policy Questions:

- The public was promised that TraceTogether data would be used only for contact tracing – it was revealed that the Criminal Procedure Code allows police officers to use TraceTogether data for criminal investigations and overrides TraceTogether's privacy policies.

Why pass a bill making it legal for TraceTogether data to be used in specific criminal investigations instead of passing a bill to ensure that TraceTogether data would only be used for contact tracing?

- Are there proper counters to prevent departments from intentionally or accidentally sharing our data and information with other agencies, or employers, or even governments? How might these drive or reshape our consumer habits cyclically?

Finally...

Users who modify TraceTogether tokens could be breaking the law

TraceTogether – Policy Analysis

Under the Computer Misuse Act, unauthorised access to computer material carries a jail term of up to two years, a fine of up to \$5,000, or both.

Those who make unauthorised modifications of computer material can be jailed for up to three years, fined up to \$10,000, or both.

Infectious disease specialist Leong Hoe Nam said those who tamper with the token are irresponsible and put others at risk.

He said: "Manipulating the token is akin to sabotaging your country. Why are they so thick-headed?"

Why is taking a look at the token a crime? :P
